Rocks and minerals are important for learning about earth materials, structure, and systems. Studying these natural objects incorporates an understanding of earth science, chemistry, physics, and math. The learner can walk away with an understanding of crystal geometry, the ability to visualize 3-D objects, or knowing rates of crystallization.

The fundamental concepts of mineralogy and petrology are explained in this highly illustrated, full-color textbook to create a concise overview for students studying Earth materials. The relationship between minerals and rocks and how they relate to the broader Earth, materials and environmental sciences is interwoven throughout. Beautiful photos of specimens and Crystal-Maker's 3-D illustrations allow students to easily visualize minerals, rocks and crystal structures.

Facts about rocks and minerals. Of the over 4000 minerals on planet Earth, only about 30 of them can be commonly found in Earth's crust. There are seven different physical properties or characteristics used to identify and label minerals: crystal form, hardness, fracture or cleavage, luster, color, streak, and density. 95% of the Earth's crust is made of igneous rock.

They are made up of layers of minerals, rock particles or organic materials. The layers are formed over time as materials carried by water are deposited at the bottom of lakes, rivers and oceans or are transported by wind or ice along the Earth's surface. Examples of sedimentary rocks include conglomerate, shale, limestone and sandstone. The shore of the Bay of Fundy (between Nova Scotia and New Brunswick) is a great place to see exposed sedimentary rock.

Earth materials include minerals, rocks, soil and water. These are the naturally occurring materials found on Earth that constitute the raw materials upon which our global society exists. Earth materials are vital resources that provide the basic components for life, agriculture and industry. Earth materials can also include metals and precious rocks. Oceanic-continental convergence resulting in subduction and volcanic arcs illustrates one effect of plate tectonics. Cross-cutting relations can b

Weathering is the breaking down of rocks, soils, and minerals as well as wood and artificial materials through contact with the Earth's atmosphere, water, and biological organisms. Weathering occurs in situ (i.e., on site, without displacement), that is, in the same place, with little or no movement, and thus should not be confused with erosion, which involves the transport of rocks and ...
