The cost of production in an industry depends on the rate of output which is important in economic analysis of cost .the relationship between cost and output determines the cost function. Once the cost function is determined estimates of future cost of production at various output levels can usually be obtained. 11.

Let s = selling price per unit v = variable cost per unit FC = fixed cost per period Q = volume of production The total sales revenue (S) of the firm is given by the following formula: S = s Q The total cost of the firm for a given production volume is given as TC = Total variable cost + Fixed cost = v Q + FC.

In engineering economic analysis we focus on the differences among alternatives, thus incremental costs play a significant role in such analyses. A cash cost is a cash transaction, or cash flow. If a company purchases an asset, it realizes a cash cost. A book cost is not a cash flow, but it is an accounting entry that represents some change in value. When a company records a depreciation charge of \$4 million in a tax year, no money changes hands.

?A cash cost requires the cash transaction of dollars “out of one person’s pocket” into “the pocket of someone else”, i.e. you are incurring a cash cost or cash flow. Cash costs and cash flows are the basis for engineering economic analysis

Chapter-2-Engineering-Costs-and-Cost-Estimating

When comparing costs among two or more possible alternatives, engineering economics may use either present or future worth analysis or annual cost. Present or future worth analysis converts all the costs of a project into equivalent present or future worth. The time period of analysis must be the same for all options for this method to be valid.

What-is-Engineering-Economics?-with-pictures

Being one of the most important and integral operations in the engineering economic field is the minimization of cost in systems and processes. Time, resources, labor, and capital must all be minimized when placed into any system, so that revenue, product, and profit can be maximized.

Cost engineering is “the engineering practice devoted to the management of project cost, involving such activities as estimating, cost control, cost forecasting, investment appraisal and risk analysis.” “Cost Engineers budget, plan and monitor investment projects. They seek the optimum balance between cost, quality and time requirements.” Skills and knowledge of cost engineers are similar to those of quantity surveyors. In many industries, cost engineering is synonymous with project controls. As

Example (FEIM): The initial cost of a proposed project is \$40M, the capitalized perpetual annual cost is \$12M, the capitalized benefit is \$49M, and the residual value is \$0. Should the project be undertaken? B= \$49M, C= \$40M + \$12M + \$0
