The pipe or tube is restrained at two eternal points and a ram in the shape of the bend advances on the central axis and deforms the pipe. The bent pipe or tube is prone to deformation on both the inside and outside curvature. The pipe or tube is often deformed into an oval shape depending on the wall thickness of the material.

There are many different methods of tube and pipe bending and Barnshaws carry out the majority of them. Tube & Pipe Bending Information. Mandrel Bending. This form of bending generally is used for tighter radii in tube (typically 3D ie; the radius is 3 times the o/dia of the tube). It controls the flow of plasticizing material at the point of bend in order to maintain the shape of tube as it ...

The next step up is a simple manual pipe bending tool, a type often used by plumbers for copper tube. To produce more complex multi-bend components, for small diameter tube where it is possible to bend it manually, hand bending jigs use compression bending. Some quite elaborate shapes can be produced.

Copper is formable. Because copper tube can be bent and formed, it is frequently possible to eliminate elbows and joints. Smooth bends permit the tube to follow contours and corners of almost any angle. With soft temper tube, particularly when used for renovation or modernization projects, much less wall and ceiling space is needed.

Bending Forces As a tube or pipe is being bent, the exterior wall at the point of the bend begins to stretch and thin out. Simultaneously, the corresponding interior segment of the workpiece becomes thicker and more compressed. Controlling these degrees of physical deformation is important for creating a smooth rounded bend.
