Principles of spread-spectrum communication systems

spread-spectrum communication is a staple topic in textbooks on digital com-munication, its treatment is usually cursory, and the subject warrants a more intensive exposition. Originally adopted in military networks as a means of ensuring secure communication when confronted with the threats of jamming and interception, spread-spectrum systems are now the core of commercial ap-

PRINCIPLES OF SPREAD-SPECTRUM COMMUNICATION SYSTEMS

Techniques known since the 1940s and used in military communication systems since the 1950s "spread" a radio signal over a wide frequency range several magnitudes higher than minimum requirement. The core principle of spread spectrum is the use of noise-like carrier waves, and, as the name implies, bandwidths much wider than that required for simple point-to-point communication at the same data rate.

Theoretical Justification for Spread Spectrum. 3DJH RI . Spread-spectrum is apparent in the Shannon and Hartley channel-capacity theorem: $C = B \times \log_2(1 + S/N)$ (Eq. 1) In this equation, C is the channel capacity in bits per second (bps), which is the maximum data rate for a theoretical bit-error rate (BER).
